Our Mission

Many parents have trouble looking for a toy that would kick-start a child's interest for robotics and engineering, which should enhance the child's learning capabilities and allow his/her creativity to expand. The Asian Equation's mission is to provide users a "build it yourself" toy kit to increase interest in STEM.

Special Features

- The Broom Broom has a drivable base, so the user can control the catapult with the remote controller.
- The catapult can shoot the provided balls for unlimited fun.
- The Broom Broom requires little prior engineering experiences or knowledge for assembly, just the curiosity to learn.

Broom Broom

The Broom Broom is a "do it yourself" remote controlled catapult toy kit. The kit contains 61 parts, including the drivable base, that the user can assemble using the tools provided in the box. The assembled catapult has an endless amount of possibilities.
